01 Tansu Vault

Your Tansu project has a Vault

Add a Vault to your project to manage easily your treasury.

A vault to generate yield for projects

- **Defindex** - Used to make a vault for all projects registered on Tansu
- **Soroban Domains -** Tansu projects all have their domain, we resolve to the address
- **Reflector** - We get the price conversions for better user experience

Manage your treasury

Send funds from your Soroban Domain address to the vault. And withdraw after you generated some yield.

01 | Carbon offset

A vault which offsets carbon

- **Soroswap:** we swap vault fees to CARBON
- **RPC getContractData:** calculate normalized user contributions
- **Stellarcarbon SDK:** sink CARBON for each
